PaisaPath: M2 Progress Report

Team **Cache me if you can** · Problem: Vanguard, Community Stewardship · Report date: 10 October 2026 · Due: 11 October 2026, 04:00

1. Where we are

PaisaPath now runs as a working web app with four fictional-money missions that match the M1 plan (budgeting, saving, future planning and scam safety), a playable 3D neighbourhood with a first finance mission, a redesigned home screen, and offline fallbacks. The core loop works end to end: a student makes a choice, sees its consequence, reads a plain-language explanation, earns XP, and can replay. AI is optional. The main gaps against M1 are the backend and database, the ₹200 budgeting mission as specified, sign-language clips, and any testing with learners.

2. M1 plan against what is built

M1 item	Status	What exists in the repository
Connect: language, interests, mood	Partial	English, Hindi and Telugu on every screen. Interests and learning style in the Learn onboarding. No mood question yet.
Discover: warm-up and baseline	Partial	Learn onboarding plus a one-question instinct check that sets a starting level. No separate 4–5 question warm-up or baseline score.
Wallet Warrior (budgeting)	Built	Life Mode world with everyday spending scenarios and a phone-repair surprise. Opening cash is ₹500, not the planned ₹200.
Goal Guardian (saving)	Built	Goal choice, emergency fund and repayment scenarios. The 3D mission also teaches saving instead of buying.
Future Lab (risk and time)	Built	Compound growth comparisons, with fictional outcomes only. No real transactions or investment advice.
Scam Detective (safety)	Built	Four scenarios: a KYC SMS, scam recovery, a collect request and a fake screenshot.
Reflect: consequences, XP, badges	Built	Deterministic outcomes, levels, achievements, and concept explainers with worked examples. Replay supported.
Ask the helper; voice	Partial	Gemini mentor with voice input and spoken replies when a key is present. Without a key, it logs spending and income offline.
Backend API and database	Not built	Progress is saved in the browser only (localStorage). No server, no accounts.
Accessibility controls	Partial	Audio Mode (Space to talk, R to repeat), focus rings, reduced-motion support, touch controls. No high-contrast mode, no captions.
Sign-language clips	Not built	Optional in M1. Not started.
AI optional, with fallbacks	Built	Life Mode needs no AI. Learn falls back to pre-built scenarios. The mentor works offline.

3. Experiments and testing so far

Test area	What we ran	Result
Automated tests	80 tests in 8 files: Life Mode rules, ledger and storage (50); 3D economy and collision (16); offline parser and progress (11); translation parity (3).	80 of 80 pass
Build and type check	**npm run check**: type check, all tests, production build.	Passes
3D mission walkthrough	Headless Chromium. Walked to Ravi, took the delivery job, chose to save, then paid the phone repair from savings.	Cash, savings and mission step matched every choice
Offline mentor	Typed “I spent 120 on lunch and got 500 from my aunt” with no AI key.	₹1,000 + ₹500 − ₹120 = ₹1,380. Correct.
Responsive layout	Home screen at 1280 px and 390 px.	Bugs found and fixed: a 3D camera inside a building, and 8 px of sideways scroll on phones.
Not yet run	Peer observation with learners. Keyboard-only and screen-reader audit. Slow and no-network tests on Learn screens. Edge-case inputs in the mentor.	Planned for the final submission

4. Risks and next steps before final

- **Gemini key in the browser.** A key typed on the home screen stays in browser memory and is sent from the client. A server-side key is in draft PR #2 (other work), not merged. This must be resolved before any public deployment.

- **No backend.** Progress is per browser. Planned: a small API and database for preferences, attempts and progress, as in M1.
- **M1 gaps to close if time allows:** the ₹200 budgeting mission as specified, the 4–5 question warm-up, and a learner-facing summary of mission history.
- **Learner testing.** Run a small peer-observation session (about five learners, no finance background) and record the takeaways they describe.
- **Merge order.** Draft PRs #2 (server-side key) and #3 (story week) also edit the app shell, so they need to be merged in a deliberate order.

5. Code submission

Repository: github.com/suhaasps3-rgb/megathon. Life Mode is on **master** through merged PR #1. The latest work is on branch **claude/project-thread-zn9k8c** at commit **9523eca**, in draft PR #4 (3D neighbourhood mission and design pass). Main source folders: src/lifemode (missions, rules, content, storage and tests), src/components/life (Life Mode screens), src/neighborhood and src/components/world (3D world and its tests), src/services (offline mentor and progress), and src/components/Home.jsx, shell and brand (home screen, navigation and mascot).
